EL APARATO DIGESTIVO

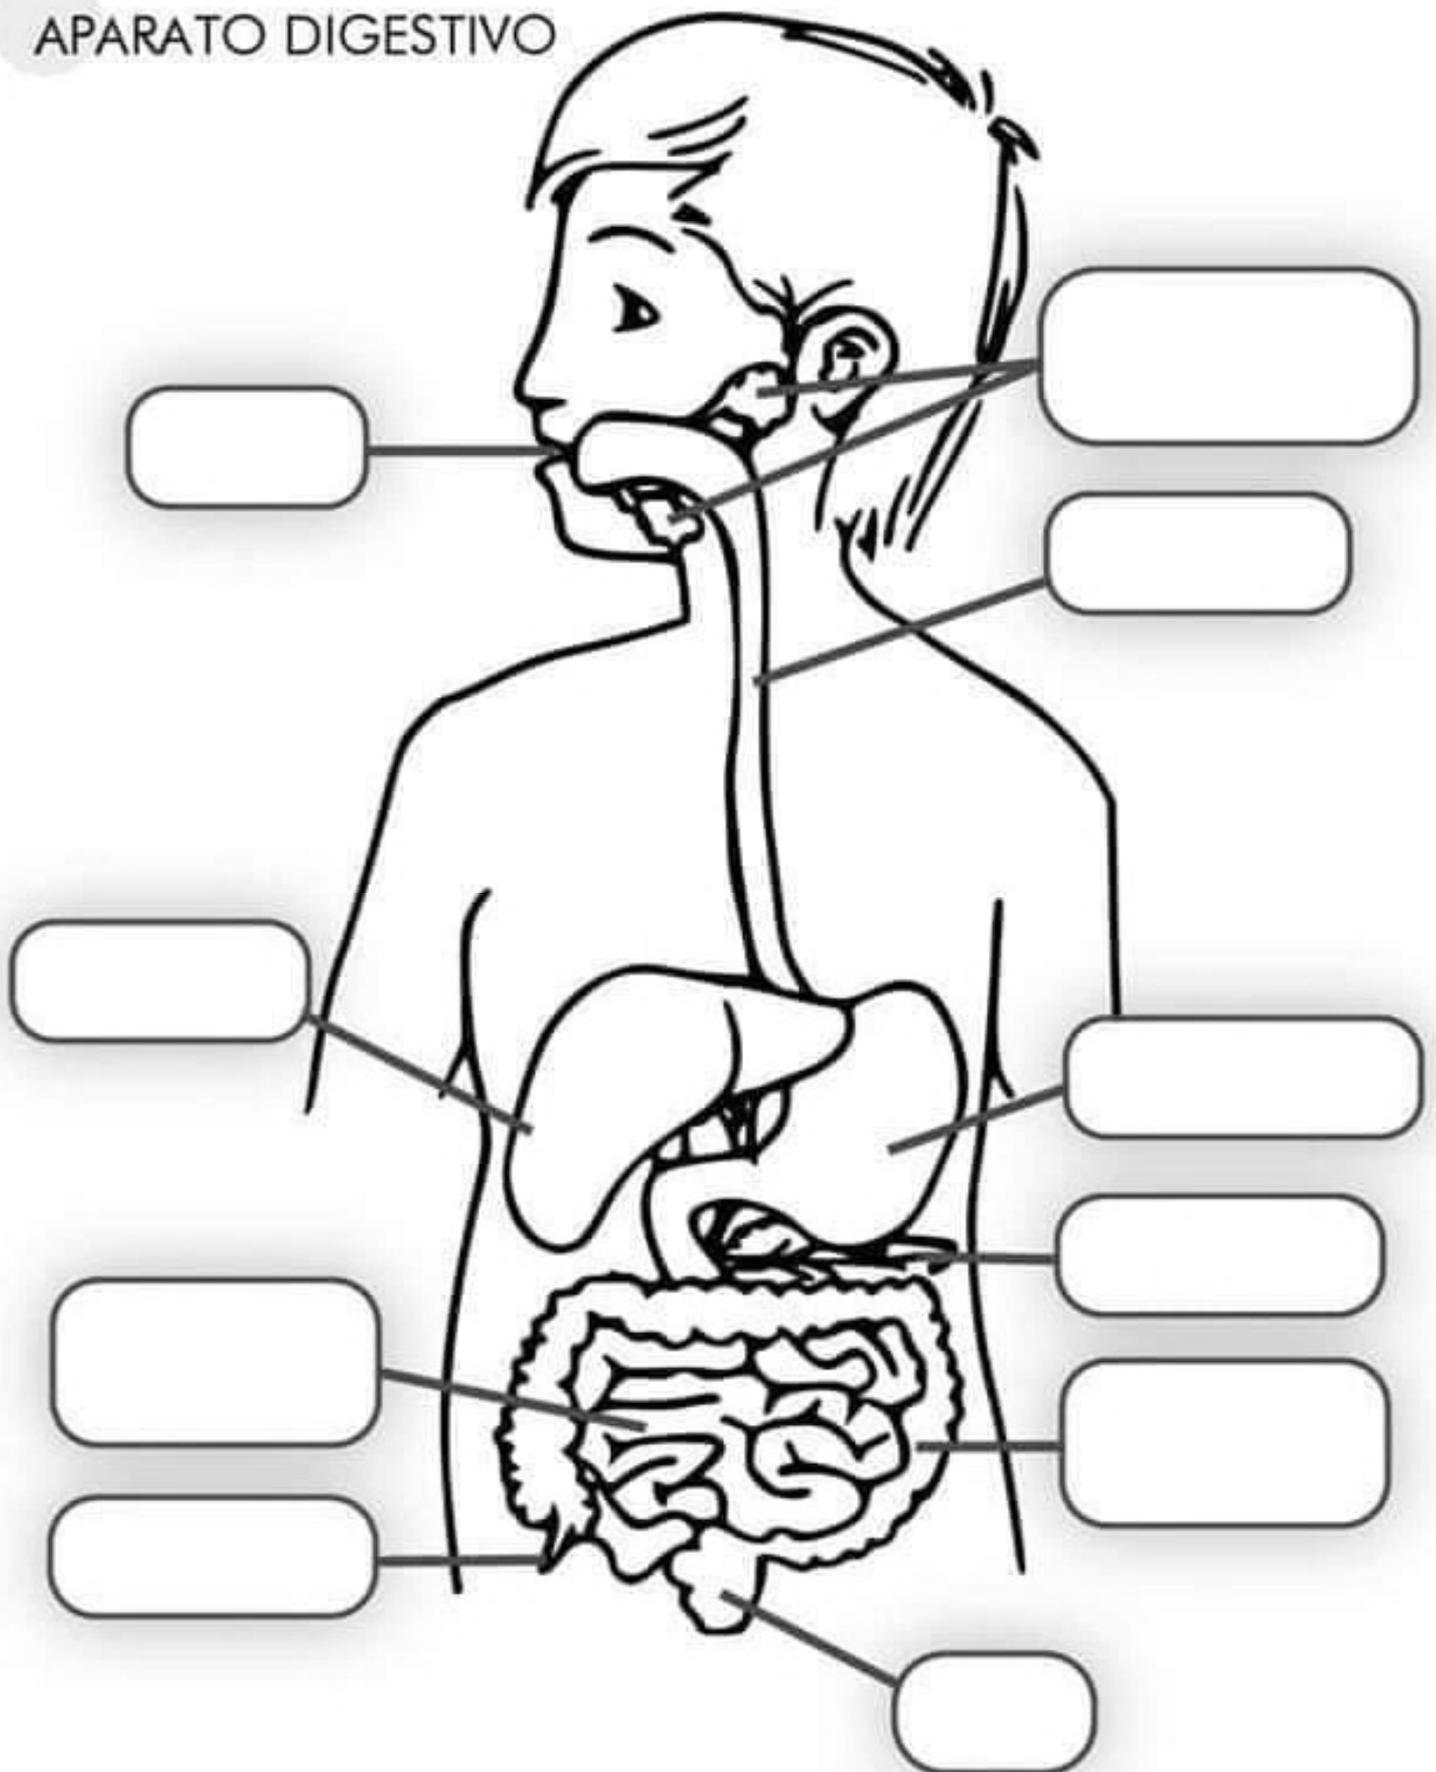

Nombre y apellidos:

Fecha: Curso:

APARATO DIGESTIVO

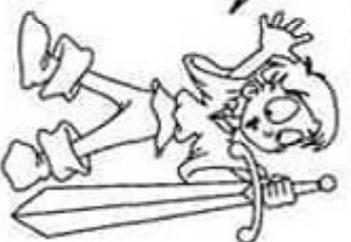

El Aparato Digestivo convierte los alimentos en nutrientes para el organismo.

El alimento que consumimos entra por la boca, donde se mastica y se mezcla con la saliva formando así el bolo alimenticio, que pasa por la faringe y después al estómago.

El hígado segrega bilis, la cual pasa por la vesícula y ésta, a su vez, la envía al intestino delgado. La bilis ayuda a digerir las grasas.

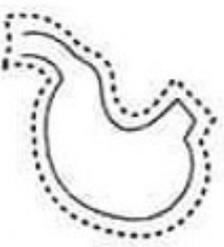

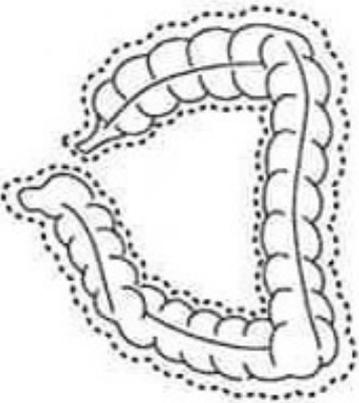

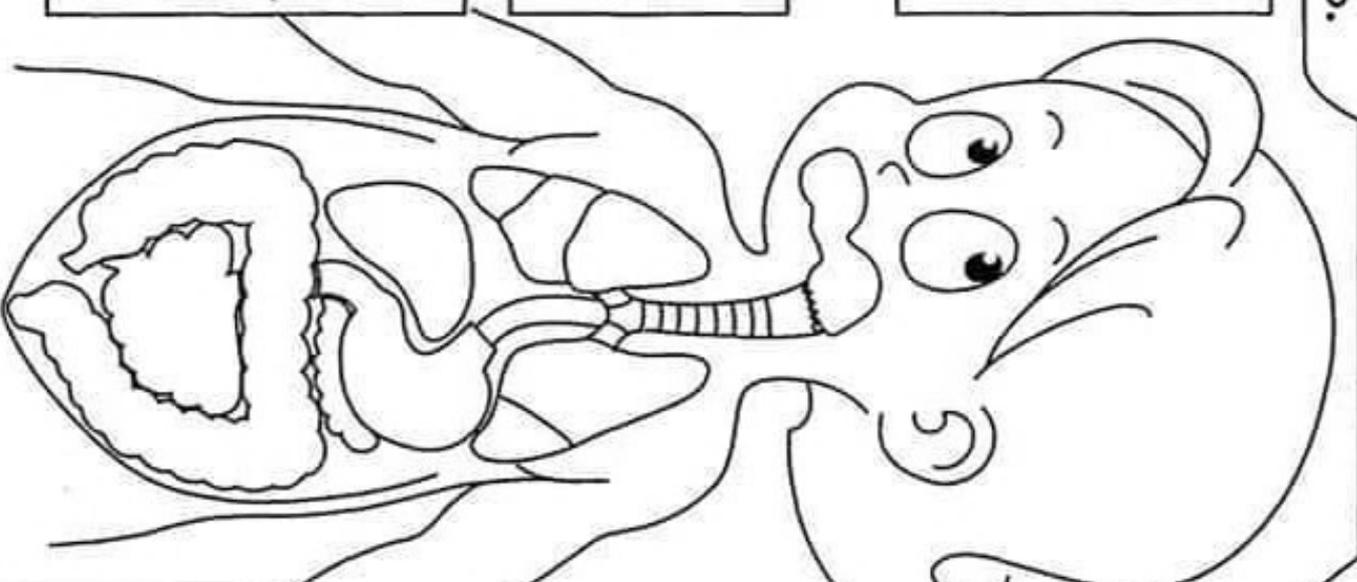

Al pasar al intestino delgado, la bilis y el jugo pancreático se mezclan con el jugo intestinal, terminando así la digestión. Los nutrientes pasan a la sangre y los residuos al intestino grueso.

La misión del estómago es mezclar el jugo gástrico que segrega con los alimentos ya masticados y ensalivados, y después los vacía lentamente en el intestino delgado.

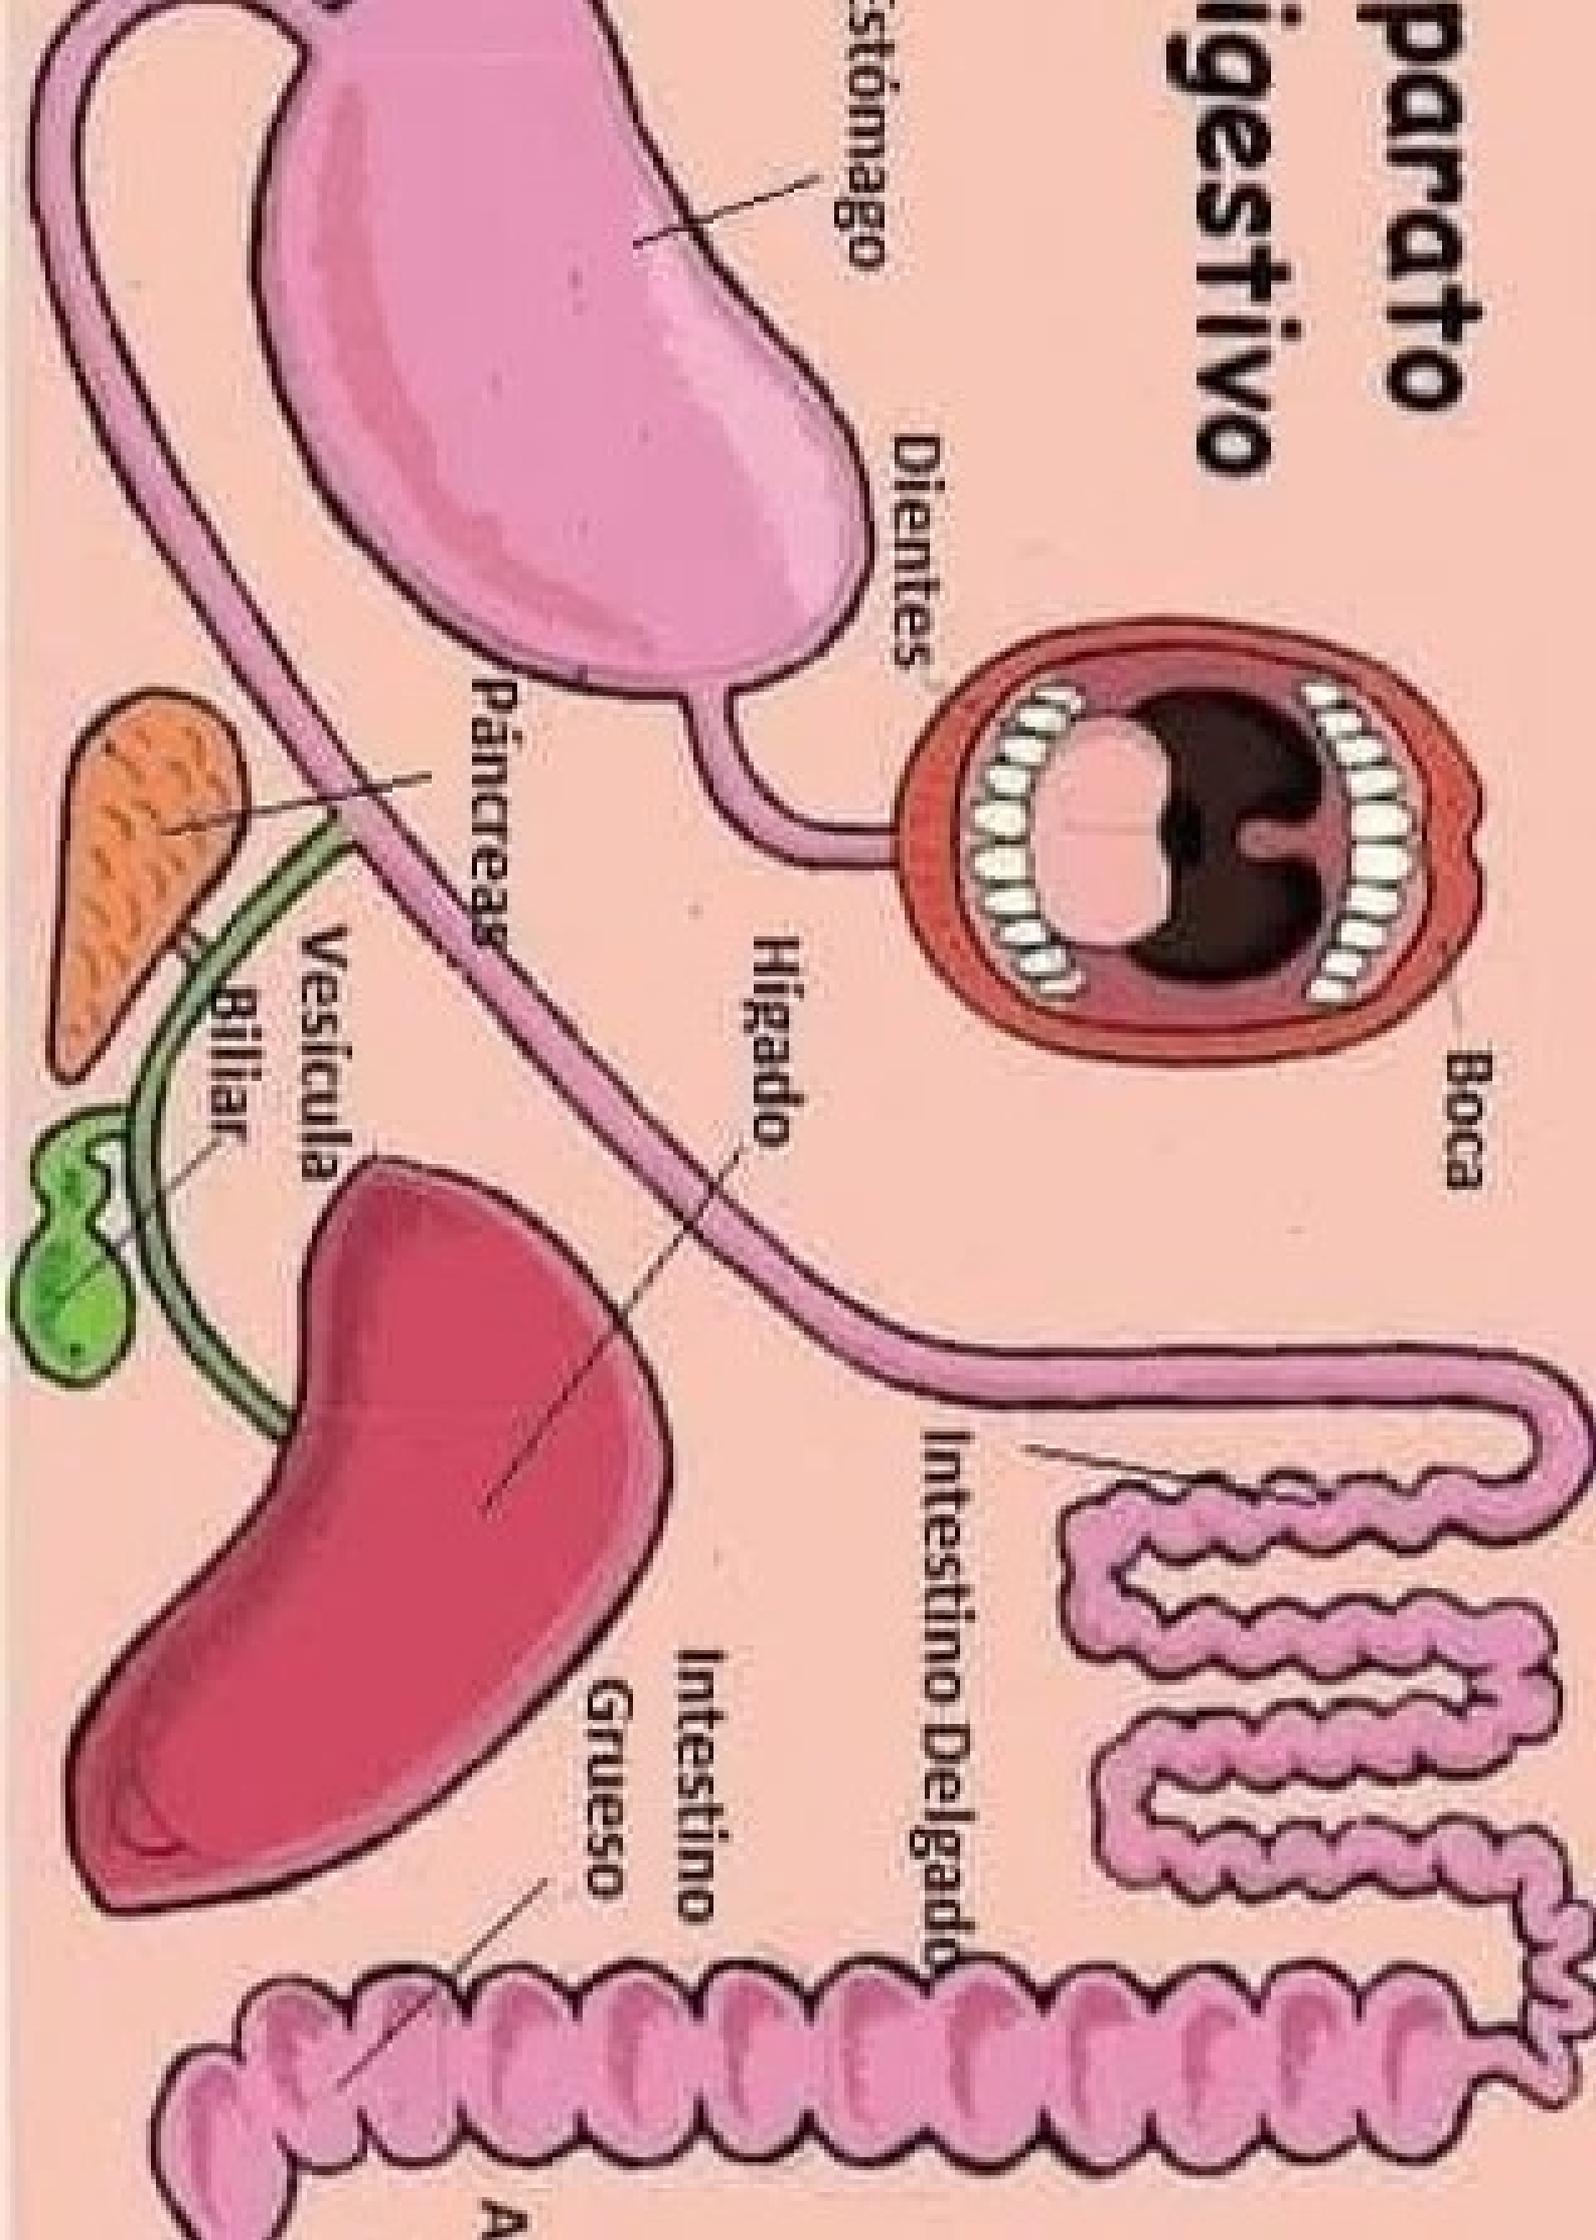

El páncreas vierte en el intestino delgado el jugo pancreático, que descompone las grasas, azúcares y proteínas de los alimentos.

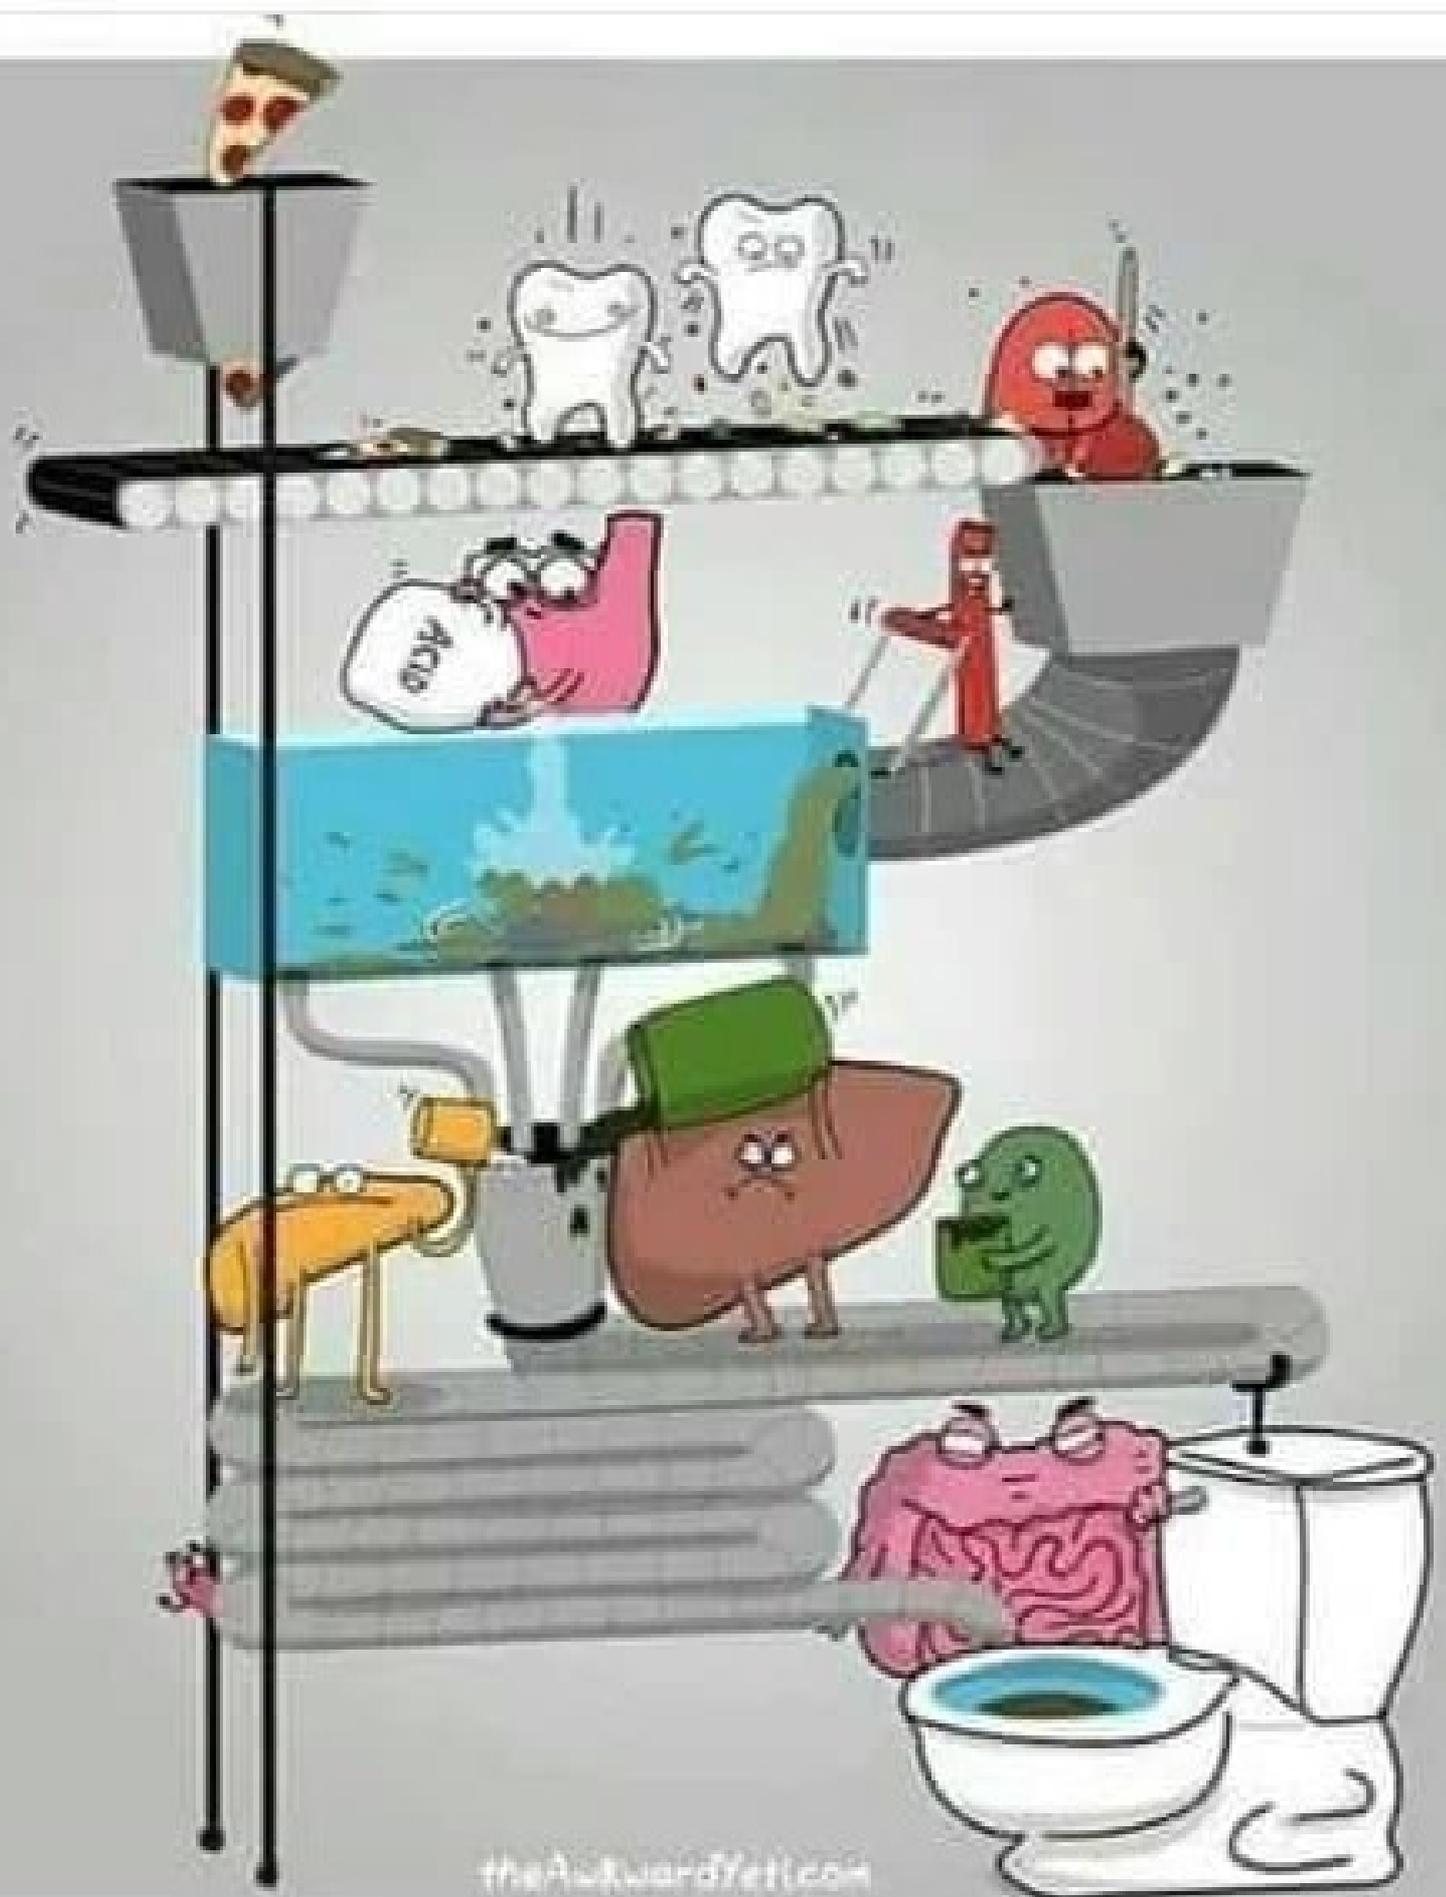

Los residuos de la digestión pasan al intestino grueso y se forman las heces que se arrojan por el recto.

Recorta las partes del aparato digestivo y pégalas en el lugar correspondiente.

Educativas.com

Los seres humanos necesitamos alimentarnos para que la comida aporte energía a todo el cuerpo y desechar lo que no necesita.

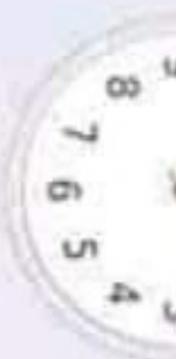

El aparato digestivo es el que realiza este trabajo que se llama digestión. Se encargará de extraer los nutrientes y trasladarlos al aparato circulatorio para que los distribuya todas las partes del cuerpo.
